Vanguard Digital
A/B Testing Mobile UI

Vanguard Digital Challenge Analysis

Business Context

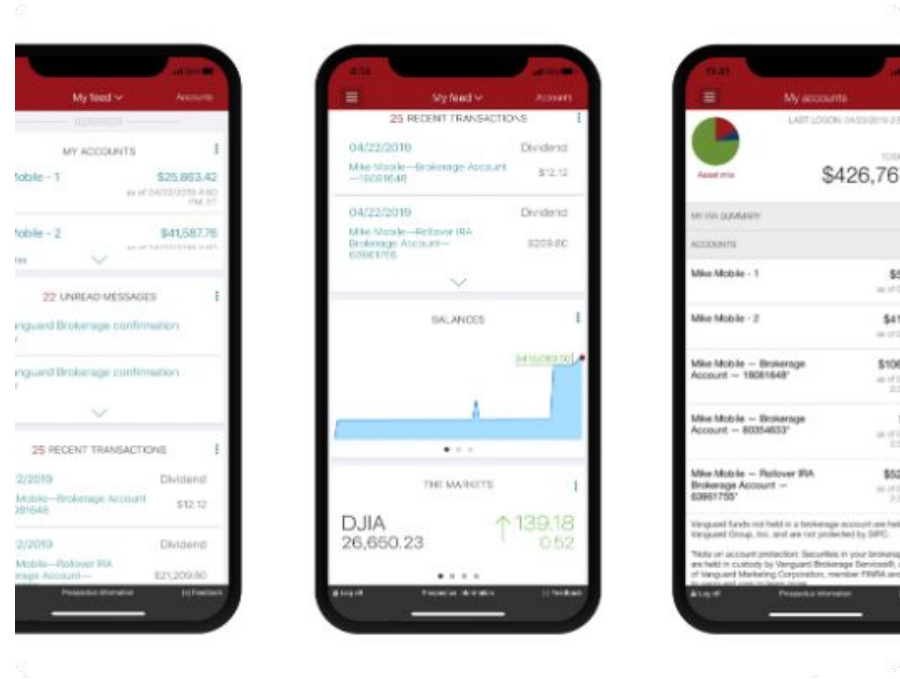

Vanguard:

- **Global investment** management company
- **Digital mobile platform** for managing investments

Objective/Hypothesis:

Does the new modern interface perform better than the old one?

- 1) Performance: Completion Rate
- 2) Navigation: User Experience

Experiment Setup

A/B Test:

- Group_1: **Control** → Current interface
- Group_2: **Test** → Redesigned interface

Analysis Scope:

- Users that started the process

Core Metrics:

- Completion
- Friction (backtracking, repeated steps)

Key concepts:

- ❖ **Friction:** Non - linear app navigation
 - **Backtracking:**
People who went back in the steps
 - **Repeated steps:**
Repeating the same step more than once

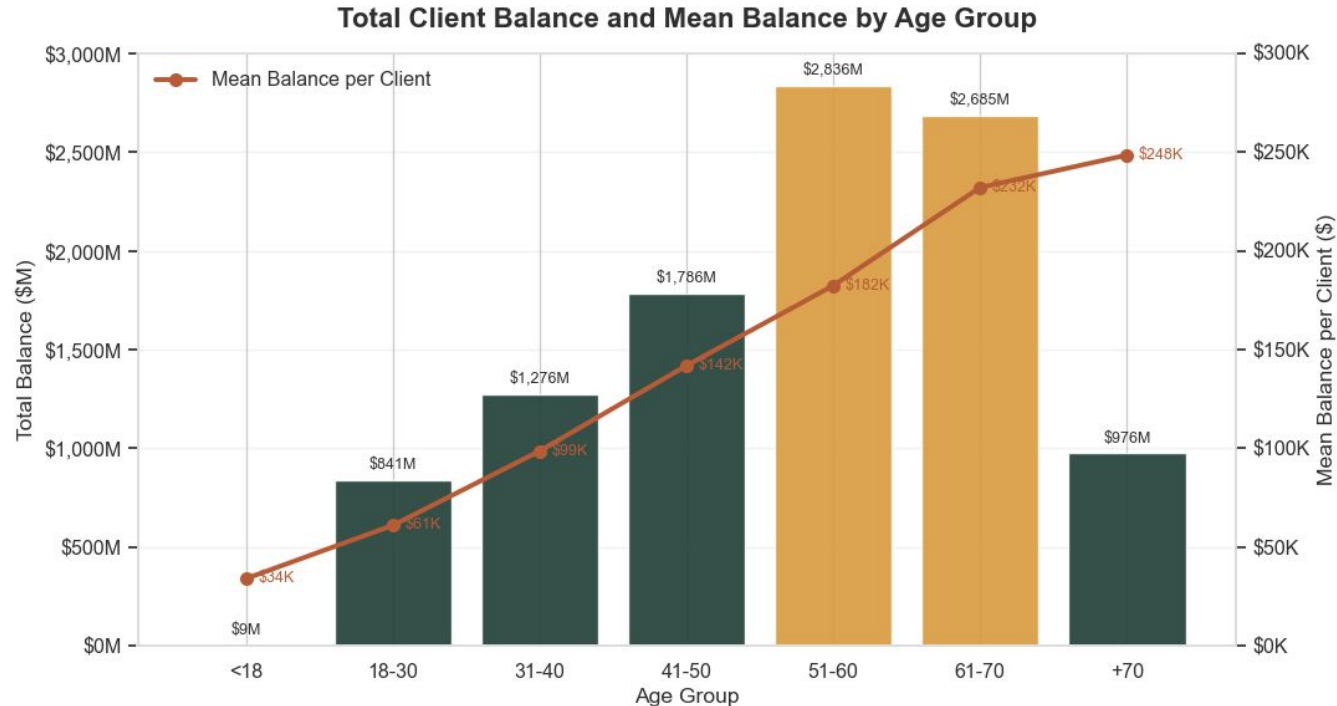

KPI'S:

- **Completion Rate:**
percentage of started sessions reaching confirm
- **Friction Rate:**
percentage of started sessions not following a clean journey
- **Efficiency:**
Median completion time

Vanguard's most desired Customer Profile

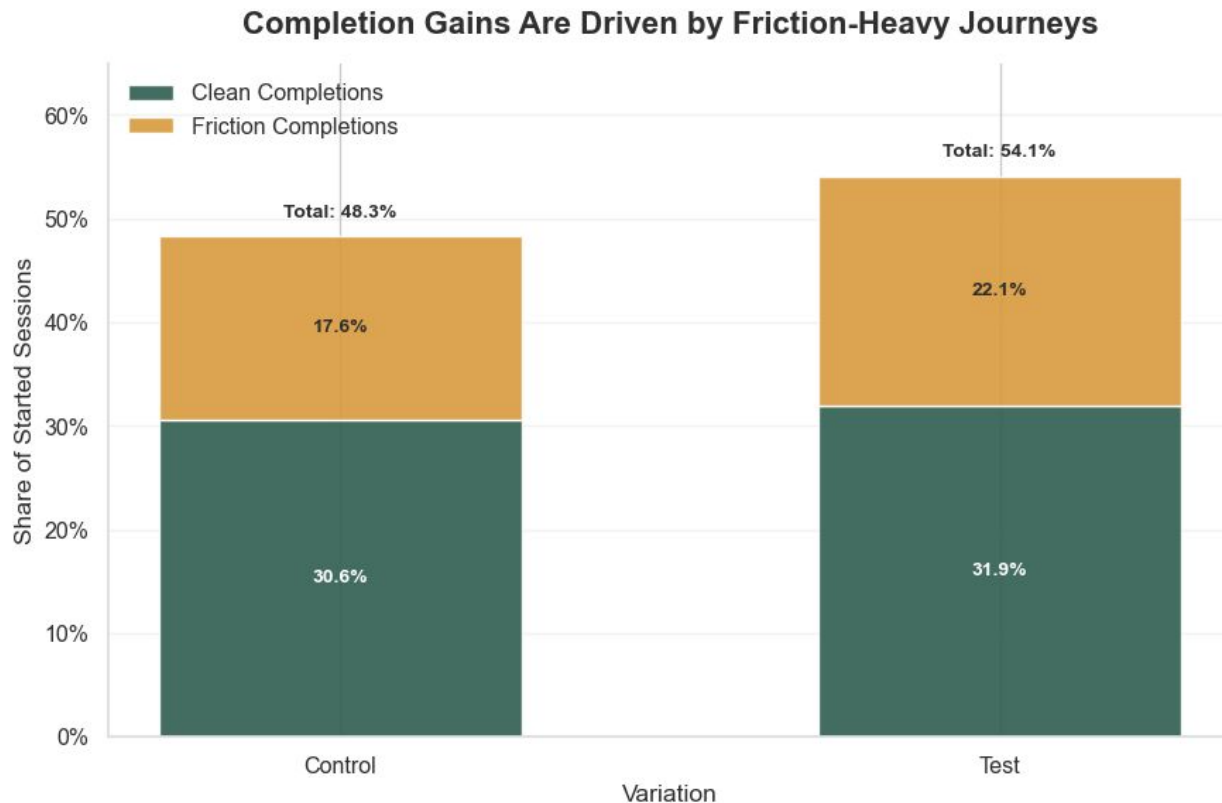

- Client base concentrated in adult segments
- Largest segment: 50–59 (≈22%)
- Younger users represent a small share
- Gender are represented equally
- Client value increases with age, with 51–70 representing the largest share of total balance

First results

Where does the improvement come from?

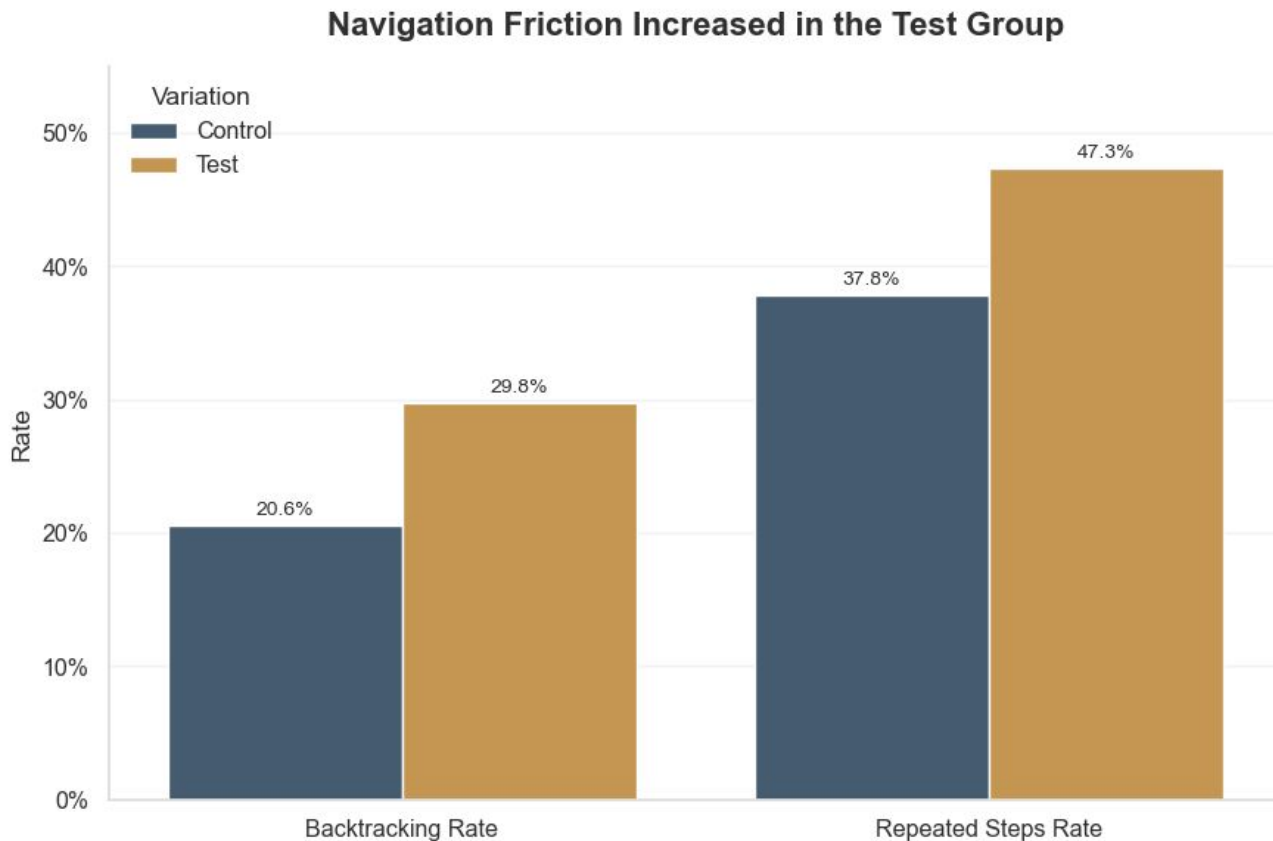

- Completion increases in Test
- Most of the uplift comes from friction-heavy journeys
- Median Completion Time:
 - Control: 4.52 min
 - Test: 3.95 minFaster ≠ simpler
- About ~68–69% of sessions involve friction

Navigation friction

What type of friction increased?

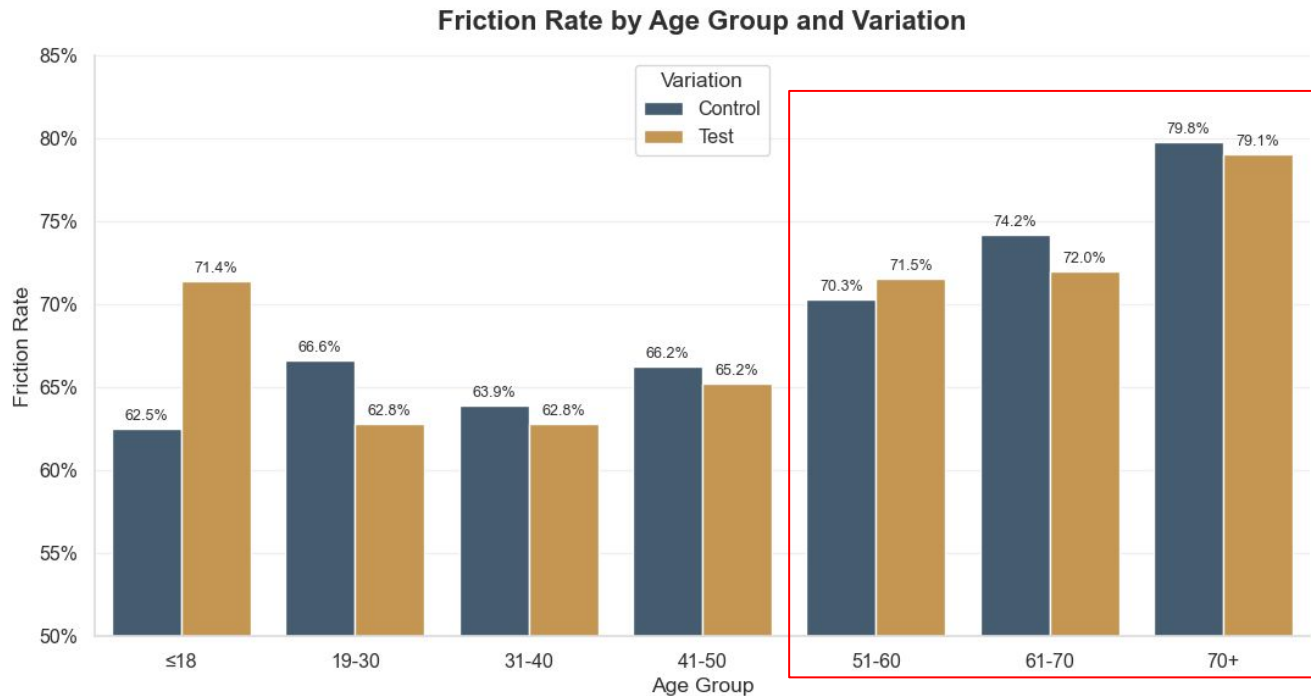

- Backtracking increased by +9.20 pp
- Repeated steps increased by +9.55 pp
- The new interface increased non-linear navigation

Friction impact by age

Friction Impact by Age

- Friction increases with age
- Older users are more affected
- High-value clients are more exposed to friction

Business Risk

- Friction tends to increase with user age
- High-value clients experience a disproportionate impact
- Navigation complexity is higher in the test group

The new version may negatively impact Vanguard's most valuable customers, posing a significant risk to retention and satisfaction

Recommendations

Do not proceed with the rollout of the current interface in its present form

Next Steps:

- Conduct a detailed analysis of friction points across user journeys
- Identify and prioritize the most problematic interaction steps
- Redesign and streamline navigation before any broader deployment

Key takeaway

- Higher completion $\neq$ better experience
- Completion rates have improved, but significant friction remains in the user experience and is not at an acceptable level
- Reducing user friction is a prerequisite for launch readiness

THANK YOU FOR YOUR ATTENTION!
